The Influence of Confucianism on Para-sport activism

Abstract

Academics and sport organisations have recently recognised Para-sport as a powerful platform for disability activism. However, little attention has been given to Para-sport activism in non-Western cultures. This study explored the influence of Confucianism on South Korean Para-sport activism. Data were collected through interviews conducted with four stakeholders from the Korea Paralympic Committee and eighteen Para-athletes. Through a reflexive thematic analysis, we crafted five themes corresponding with Confucian values: position hierarchy, age hierarchy, parent-child relationship, factionalism, and collectivism. All values had the capacity to encourage and discourage participants towards engaging in activism. These findings contribute to the field of sport sociology by highlighting a multitude of cultural factors affecting Para-sport activism. Practical suggestions to promote Para-sport activism are offered, including sociocultural and organisational legacy.

Key words: disability sport; athlete activism; Cultural Sport Psychology; Confucianism; South Korea
Introduction

Para-sport activism is gaining attention around the world due to the potential of disabled elite athletes to highlight forms of oppression that disabled people experience, such as negative attitudes, inaccessible environments, or social exclusion (see Haslett & Smith, 2020). In Para sport research, disability is increasingly conceptualised towards a social model (i.e., disabled people are limited not by their impairment but by the environment) or a human rights model (i.e., disability as a rightful part of human diversity), in contrast to a medical model understanding (i.e., disability is the lack of ability due to impairment) (Smith & Bundon, 2017). Here we follow Smith, Bundon, and Best (2016) in defining Para-sport activism as action taken by disabled elite athletes or Para-sport organisations to challenge the oppression of disabled people, both within and outside sport contexts.

A number of recent academic works are now available on Para-sport activism (see Braye, 2016; Bundon & Clark, 2015; Choi, Haslett, & Smith, 2019; Haslett, Choi & Smith, 2020; Haslett, Monforte, Choi, & Smith, 2020; Haslett & Smith, 2020; Smith, Bundon & Bust, 2016). Moreover, the International Paralympic Committee (IPC, 2019) has developed an agenda to use Para-sport as a platform to advocate for disability rights. Despite this increasing interest around the topic, there remain important shortcomings in what we know about Para-sport activism. For instance, the IPC emphasises that the voices of both disabled elite athletes and Para-sport organisations, such as National Paralympic Committees (NPC) need to be considered, yet most of previous research has paid exclusive attention to ‘current disabled elite athletes’ as the sole agents of Para-sport activism. Acknowledging these NPC members’ perspective is critical because, through their positional advantage, they have a powerful impact on planning, organising and directing the Para-sport movement (Patatas, De Bosscher, Derom, & De Rycke, 2020).

Likewise, empirical evidence about Para-sport activism has been circumscribed to the Western culture, and little is known on the realities of non-Western countries. The present study addresses such gaps by considering the credible voices of South Korean disabled elite athletes and Korea Paralympic Committee (KPC) board members.

In what follows below, we describe our theoretical approach, which led us to define the research questions.

Theoretical approach and research questions

The cultural frame in which Para-sport activism unfolds matters deeply because culture shapes self-identity such as how we think, feel, and behave (McGannon & Smith, 2015). Even though ignoring the cultural dimension is to miss a key matter that shapes Para-sport activism, in this field of research cultural influences seem to be a by-product rather than a focus. If considering studies based on Western countries (e.g., Bundon & Clark,
2015; Haslett et al., 2020), for example, the cultural gap is moderate, and naturalistic generalisations (those reached on the basis of recognition of similarities to the results with which the reader is familiar) are feasible (Smith, 2018). However, South Korean culture possesses different cultural elements. Given the absence of knowledge on the South Korean context, acknowledging the cultural perspective seems relevant and timely. Following this reasoning, we adopted a Cultural Sport Psychology (CSP) approach. A CSP approach emphasises different cultural values (e.g., how people think and interact with other people) and personal meanings in social interactions, from decontextualised knowledge to new perspectives (McGannon & Smith, 2015; Schinke et al., 2019). Thus, CSP plays a crucial role in understanding athletes’ identity construction as a social process that constitutes and shapes an individual, not only as one that provides external meaning (McGannon & Smith, 2015).

In this study, CSP initially felt adequate for the study design. Progressively, though, it acted as a sensitising approach. Namely, it encouraged deeper consideration for the influence of cultural values and pushed us to consider what makes South Korea a unique cultural context.

One of the key cultural element that makes a difference in how people approach social interaction in South Korea is Confucianism, a core philosophical system advocating group harmony with hierarchical order for political, social, and family relations (Sleziak, 2014). Confucianism has been dominant in South Korea for thousands of years, reflecting not only what identity people have but also outlining how people should behave in certain contexts, including disability, sport, and activism (Choi, 2005; Choi et al., 2019; Sleziak, 2014). Against this backdrop, the present research focuses on the following questions: 1) Which values and features of the Confucianism philosophy have been adopted in Para-sport? and 2) How did these factors act as motivators and barriers to engage in activism?

Methods

Design

Given our need to understand cultural praxis, we adopted a qualitative design, which aligns with the CSP genre (McGannon & Smith, 2015). Our qualitative research was underpinned by ontological relativism (i.e., reality is multifaceted and dependent on an individual’s consciousness) and epistemological constructionism (i.e., knowledge is subjective and constructed through inter-dependent relationship) (Sparkes & Smith, 2014). In line with CSP approach, this design informed our research questions and methodology, as well as allowed us
appreciating how the research participants draw upon cultural meanings and social norms to construct their subjective perceptions on activism. Thus, we considered reality and knowledge as multifaceted and constructed through interaction, rather than considering reality and knowledge as being independent of a researcher’s purpose (Smith & Caddick, 2012).

Participants

After gaining University ethical approval, we contacted the KPC to recruit disabled adults who were either (a) current disabled elite athletes or (b) KPC board members. Participants varied for age, gender, impairment type, education-level, hometown, and sport types. Prior to their participation, we obtained their informed consent and told them of their right to withdraw from the study at any time without penalty. The current disabled elite athletes group (aged between 22 and 56 years; 1 female and 17 males) included 18 elite athletes who either represented South Korea in international-level Para-sport games (e.g., Pyeong-Chang Paralympic games 2018, Rio Paralympic games 2016, and Indonesia 2018 Asian Para games) or planned to represent South Korea in Tokyo Paralympic games 2020. Disabled elite athletes were purposively selected based on activism orientation scores measured in a previous study (Choi, Haslett & Smith, 2019). The KPC group (aged between 53 and 63 years; 1 female and 3 males) included four active board KPC members who represented South Korea in international-level Para-sport games when they were younger as former athletes. On average, the KPC members were 20 years older ($M = 56.75, SD = 4.11$ years) than the current disabled elite athletes ($M = 36.17, SD = 8.55$ years).

Data collection

The first author, non-disabled, female, and 27 years old, collected the data by conducting interviews. All interviews were conducted face-to-face at an accessible location of the participant’s preference (e.g., a café near their house, participant’s home, their workplace). At all times, she maintained a critical and transformative position whereby the rights of disabled participants were prioritised and kept questioning her own notion of normalcy (Brighton & Williams, 2018). Also, she paid attention to being sensitive when asking personal questions, even when asking about topics that may have not seemed sensitive in nature, with the aim to put participants at ease and encourage honest responses (Brighton & Williams, 2018). An interview guide was crafted before interviews began. Questions included, “From a Confucianism point of view, what motivates (demotivates) you to do activism?”. Some questions were tailored to each group according to their distinctive features. For example,
the current disabled elite athletes were asked, “What do you think about elite athletes’ status in the disability society?” The KPC members were asked their two different perspectives of former athletes and KPC board members on Para-sport activism, such as “Could you share your experiences of activism when you were an elite athlete compared to now as KPC board member?” Each interview (lasting approximately two hours) was recorded and then transcribed verbatim. In order to protect the identity of the participants, sensitive information was removed from the transcripts and each participant was assigned a pseudonym.

Data analysis

We (one female Asian and three male Europeans, all non-disabled) conducted a reflexive thematic analysis in six phases (Braun & Clarke, 2006, 2019). Asian cultural background could be thought to generate an ingrained cultural bias. However, this background fostered critical thinking ensuring sensitivity to cultural diversity. The European authors generated additional critical insights and developed an enriched understanding (Smith & McGannon, 2018). In terms of how this analysis was done, we firstly familiarised ourselves with the data (e.g., reading the transcripts multiple times and noting down initial ideas or patterns). Second, we generated codes from data that appeared to contain interesting features in relation to the research purpose. All codes were determined through a semantic approach (e.g., within explicit or surface meanings). Third, we clustered codes at the level of themes (e.g., sorting all data relevant codes into potential themes) and then we identified candidate themes and sub-themes. Fourth, we reviewed our themes to form a coherent pattern and created themes within internal homogeneity and external heterogeneity. Fifth, we generated clear definitions for each theme and clarified how each theme fits into the overall story of the research data. Finally, we produced a report by writing our thematic analysis, intending to provide a logical, coherent, non-repetitive, and interesting story.

Rigour: Ongoing list of criteria for judging the quality of the research

Regarding the issue of rigour, we used a ‘characterising traits’ approach, whereby evaluative criteria for rigor/trustworthiness were viewed as contingent on epistemology, methods, study aims, and context (Burke, 2016). In consonance, we elaborated on an ongoing list of criteria (see the essential points in Table 1). In order to elaborate and refine the criteria that constitute the list, we carried out the following tasks. First, we discussed the latest debates about how relativist research might be judged (e.g., Smith and McGannon, 2018). Second, we reviewed and drew inspiration from the work of other qualitative scholars who have conducted similar forms of inquiry. Following from this, we formulated a provisional list that we consulted and re-evaluated until we reached a satisfactory perception of the quality of the study. To avoid self-indulgence, our perception was critically...
Results

We crafted five themes that correspond to traditional or cardinal Confucian values, called: a) position hierarchy, b) age hierarchy, c) parent-child relationship, d) factionalism and e) collectivism. These values were present in participants’ voices, affecting what they are able to say and how they say it. Importantly, Confucian values played an ambivalent role in the participants, both motivators and barriers towards activism. To clarify participants’ multifaceted perspectives, we considered three-voice categories. The ‘current athletes’ voice category refers to the voices of disabled elite athletes who are currently active in the sports field. The ‘former athletes’ voice category refers to the voices of the KPC members thinking back when they were athletes in the past. The ‘KPC members’ voice category refers to the voices of the current active board members of KPC. As a caveat, it has to be acknowledged that such voice categories are an artificial distinction made to provide a report as clear and structured as possible. Participants talk through a single voice, but this voice is not unitary and total. Rather, it contains a plurality of consciousness and voices, whether inner voices from the past or external voices from other people. As Bakhtin (1987) put it, our utterances are ‘filled with others’ words’ (p. 89), ‘with echoes and reverberations of other utterances’ (p. 91). This means, for instance, that the voice of a KPC members contains not just the voice of the current KPC members, but also that of the former athlete they used to be, as voice is always formed in an ongoing process of anticipation and response to other voices.

Position hierarchy

The first theme representing Confucian influence on Para-sport activism was position hierarchy. This can be explained through one of the five cardinal relationships in Confucianism about the bond between ruler and subjects (Korean; 군신유의, Chinese; 君臣有義). Literally, this means that the subjects should respect the ruler as superior, and that the ruler should be the subjects’ role model (Yum, 1988). However, only the former element—the subject’s ‘loyalty’ to the ruler—is emphasised nowadays.

Around thirty years ago, social prejudice against disabled athletes was such that they were viewed as a ‘lower’ class and less worthy than non-disabled people and, which meant that they were considered simply as ‘disabled’ and not as ‘athletes’. With the hosting of the 1988 Paralympics in South Korea, some disabled athletes contrasted with the existing literature.
began to speak out against the unfair treatment. However, when engaging in activism they experienced a diverse range of offensive circumstances. For example, highly placed people in the 1980s considered disabled athlete activism as a nuisance and an interference in their work. This dismissive attitude limited the room for improvement and discouraged disabled athletes from speaking out for their rights. As one former athlete said:

People could be excluded if they were against high-level people (government or non-disabled sports organisation). ‘You know what happens when you don’t listen’, then it was sorted out. All the process seemed like the logic of power, its hierarchy. It was not a discussion between people, but they spoke in a threatening tone [Former athlete, Sung-Gyu]

Exceptionally, one former athlete commented that he was motivated to engage in activism in response to what he perceived to be a corrupted hierarchical culture during his athletic career in South Korea. In the 1980s key people attempted to exclude him from his athletic position because he had opposite opinions to theirs. The inequitable treatment created an implacable resolution to engage in activism. During that period, former athletes believed that only medallists had the opportunity and responsibility to meet decision-makers (e.g., politicians) and speak out for social changes in front of them. As one former athlete said:

Politicians or people who work at the government don’t like people who raise problems or do activism in the hierarchical country. So high-status people try to exclude activists. This was a big motivation to get a medal and speak out directly to them with an indomitable spirit. Thus, I had never missed opportunities to be a national elite athlete for 12 years. I did my best to get a medal all the time. Why? Because I want to speak out for our rights and movement. I knew that there was a special luncheon with medallists at Blue House (Korean Presidential residence) before the match. Thus, I was invited to luncheon, and could tell directly to president Noh, ‘We need this improvement with your support.’ [Former athlete, In-Sung]

Nowadays, negative social prejudices against disability have abated, and discriminative treatments against Paralympians have lessened. Due to this change, disabled elite athletes are currently seen as ‘elite athletes’ rather than ‘disabled people’ and, in turn, are given a higher status than disabled non-athletes within the disability society (Choi, Haslett, & Smith, 2019). However, within the narrower Para-sport system—established in 2005 with the formation of KPC and dominated by disabled and non-disabled board members—disabled elite athletes occupy a low position. Given their two-sided condition, we found that some disabled elite athletes with a strong
activist identity took advantage of their power on diverse social and political issues, but they had difficulty to engage in sport-based activism because this might be deemed disrespectful by KPC group. As one current athlete said:

I’m not the decision-maker yet. I think it will be possible if I get in a high position that can decide. I don’t know how far it is, but without rights of decision-making, I can’t change anything and structure a new frame. As I said before, when I put different opinions from others, people would accept mine as a wrong one. It will make me hard to keep going to engage in activism within the Para-sport context. I couldn’t explain all the things around me more logically. This is culture. We have never learnt, but we know this [Current athlete, Yun-Young]

The high status afforded by being a ‘board member’ in the KPC was identified as a source of motivation to engage in activism, since it provided access to the decision-making process. In this sense, the activism of the KPC members, even when small in extent, had a strong practical influence on society, since it facilitated the introduction of a comprehensive set of policies and practices, and helped integrate the world of business and the government into the movement. As one KPC member said:

I can get attention from people now because I am a board member. I have the advantage to change society even more because my position is close to politicians. That’s why I tried to reach this position, and made a lot of changes. This status has a tremendous advantage because I can meet and explain directly to politicians, ministers, members of the National Assembly, and even president. [KPC member, In-Sung]

*Age hierarchy*

A second theme representing Confucian influence on Para-sport activism was age hierarchy. This is reflected in another of the five cardinal relationships in Confucianism, that is the bond between older and younger brothers (Korean: 장유유서; Chinese: 長幼有序). Historically this bond meant that there is order and sequences from childhood (younger brother) to adulthood (older brother) according to biological age (Yum, 1988). However, today this relationship has degenerated in a way that younger people should now be expected to follow and respect older people, even if the age gap is slight. Thus, to be an older person is in South Korea deemed an advantage in
terms of exercising one’s rights to speak their own opinions related to social change in general. Age hierarchy also applied to Para-sport. In this study, one current athlete-activist suggested his experiences of activism were stifled by older KPC members because of his relatively young age. Another athlete-activist set forth his divergent opinions against senior people, but he believed they ignored his opinions and considered him to be an impertinent person with an antagonistic position. The tacit cultural age hierarchy in Para-sport became a motivator for senior people, but also discouragement for young current disabled athletes to do activism. As two current athletes said:

Because I am an athlete and 24 years old. I am still too young to speak out for social change. In South Korea, senior people think young people don’t know anything. That’s why I didn’t speak my opinion. I am scared that they make a kind of hierarchy. For example, when I made a small mistake against them, they shout away noisily because I am young [Current athlete, Ho-Yeon]

South Korea is a kind of country that if people who aged 30’s speak against people aged 50’s, the elderly people say, ‘He is arrogant’ and ‘He is a jerk’. I am just talking about my opinion. That’s why I hide my opinions to avoid this situation. I won’t say anything even though I want to speak out. I just spoke my opinions, but they said, ‘He has no manners at all when he talks’, I am talking about looking at it from a different angle, but they just hate me [Current athlete, Sung-Hoon]

Interestingly, current young disabled athletes strongly appealed against the negative impact of this cardinal value of Confucianism on engagement in activism, whereas few KPC members (seniors) suggested that a more strict and rigorous Confucian custom (e.g., social hierarchy) is needed in South Korean Para-sport. As a distinct example of generation gap, each generation in South Korean culture has a different perspective towards the meaning of ‘polite’. The KPC members expressed that lower-level groups (e.g., related to age) should respect and follow senior people all the time by sticking to an old tradition and practices in Para-sport culture, whereas current disabled athletes demonstrated respecting board members only on the condition of that they ensured an appropriate level of human-rights protection. As one KPC member said:

Nowadays, there are a lot of rude, young troublemakers. I think we need more [age] hierarchy in sports field at least. Now it is like disorder or chaos. I think athletes should be more polite and respect seniors and board member. I think it is necessary that they should feel uncomfortable when talking to a senior. Few years ago, we lived in such a strong hierarchical culture. Of course, I am not saying that hierarchy is correct. But now it can be a problem of human rights if I punish people or shout at them when they...
make a mistake or did something wrong. Now it can be physical assault if I flicked people on their forehead with my finger or hit their head with my fist. Confucian culture is followed less and less […] So, there is no such thing (hierarchy and respect to seniors). Thus, I made compliance (rule) at the training centre. If any elite athletes, even potential medallists, break the rules I set, they will be excluded from the national team. No matter how good they are [KPC member, Sang-In]

Parent-child relationship

A third theme representing Confucian influence on Para-sport activism was the parent-child relationship. In this research, both current and former disabled athletes insisted on the importance of their parents’ support for them to engage (or not) in sport and activism by sharing negative family environmental experiences. Culturally in South Korea, this can be interpreted partly through one of the five cardinal relationships in Confucianism describing the bond between father and son (noted that traditionally women are not considered in this cardinal factor) (Korean; 부자유친, Chinese; 父子有親) (Yum, 1988). In the past, this bond signified a relationship in which the son always had to follow and support the opinion of his father. Today, it is reinterpreted in a broader way: children – irrespective of sex or gender - should follow both their parents’ lead. Because of this, parents’ attitude has a tremendous influence on identity formation and behaviour of their children. Our analysis suggests a cross-generational parental influence on athlete-activism orientation (see Figure 1). On the one hand, some parents engaged in activism through gathering information on disability and involvement in advocacy (Poon-McBrayer & McBrayer, 2004). These parent’s behaviour helped shape an activist orientation in their disabled children and later for them to become a disabled athlete-activist.

On the other hand, other parents embraced the historically traditional social prejudice against disability in South Korea (people view disability as a family misfortune due to ancestors’ sins). With the strong influence of parents and negative social prejudices, the parents led them to keep their children mostly within the home growing up. The confinement of their disabled children was interpreted as having two different purposes: a) overprotection for their disabled children, and b) stigma associated with disability. Some disabled athletes (children) had been unwillingly subjugated to the values of their parents, and any act of rebellion against their parents was considered aberrant. For example, one athlete stopped his activist behaviours because of his parents’ shame of having a disabled child. These parents were worried that if anyone knew of the existence of a disabled son in their family this would result in family social stigma and public shame. Family is the smallest unit and a
microcosm of South Korean society, but children’s (athlete) rights have historically been disregarded, even within their family. Such disregard is manifested in how parents physically hinder and engender psychological pain in their children, which in turn, maybe became a huge discouragement for the children to engage in activism. As one current athlete and one former athlete said:

Young children do not have a prejudice towards disability. Instead adults are too biased. Even my parents and relatives prevented me to engage in work, activism, and athletic life. They used to say ‘You are disabled. Where can you go, what can you do? Stay inside and take care of yourself at home. Don’t go outside. Don’t get sicker. Don’t do anything in front of people.’ It was very hard to change their perceptions towards disability [Former athlete, In-Sung]

I think parents of disabled athletes can be a huge barrier (for activism). For example, there was a case of a former sledge athlete. He gave up the life of elite athlete because of his parents. His parents mentioned that they felt embarrassed about their child’s disability. South Koreans are always conscious of other people around them. Elite athletes are exposed to the media, so they show their disability. Activism is also the same context. Parents don’t want to tell others that their child is disabled. They are ashamed of their child [Current athlete, Chang-Seong]

Factionalism

A fourth theme representing Confucian influence on Para-sport activism was a strong factionalism. In South Korea factionalism was created by a concept identified through the word Yongo (연고), composed of two words, ‘yon (tie)’ and ‘go (having a reason)’ (Horak, 2014). Yongo refers to personal relationships in an informally-organised group. This relation is made of three ‘ties’: Hakyon (학연: education-based tie), Hyulyon (혈연: family or blood-based tie), and Jiyon (지연: regional origin-based tie). Based on South Korean factionalism, three Yongo have become closely intertwined with social movement and activism. People in relationships formed by a common Yongo basis became stalwart supporters of one another for their further achievement (e.g., social change, development of Para-sport) by securing benefits granted through such ties, rather than based on equal treatment. In this study, KPC members emphasised that strong informal connection with decision-makers was the
most important factor to obtain a powerful voice and thus achieve many benefits (e.g., career progression, securing rights, receiving subsidies). They acknowledged that factionalism helped them achieve a high position in Para-sport. As one KPC member said:

When someone wants to change society with a political approach such as budget or government policy, they cannot do anything if they don’t have personal connections and networks through university and hometown. […] There are lines according to same faction, band… for example, same university, same hometown etc. […] If someone makes a personal connection through acquaintances or similar background, the people listen once more. I was good at doing this with people. It was helpful in order to be positioned here [KPC member, In-Sung]

However, factionalism was also perceived as a strong discouragement to engage in activism by some current athletes who belonged to weaker factions. In the data, multiple factions coexisted in Para-sport. Among these factions, one was perceived to hold a major influence on society and to dominate by ‘pushing aside’ others to expand their power. For example, one current athlete stood up to defend his rights against a different faction. Therefore, he was ostracised by people (e.g., KPC members and few athletes) who belonged to the rival faction and was excluded from the national team as a form of retaliation he believed. He told that other athletes who graduated from the same university as the board members were granted a place in the national team instead of him. As he said:

I have got on the wrong side of the board members by saying opposite opinion with them. A game participation is only available for disabled who have disability level 1.0, but they raised my disability level to 1.5 when I was selected as the national team even though my level was evaluated as 1.0 in the international disability ranking system. In the sense of retaliation for not being on the same faction, board members gave their people (athletes), who have same direction or obey them, a favourable class for qualification for Paralympic. And they prevented other athletes who are opposite side to participate in the Paralympics. Surviving here is very hard. I think they are on a serious power trip lining their own pocket or rice bowls (Korean staple food) [Current athlete, Yeong-Hwan]

Few current disabled athletes maintained discretion about their faction and avoided to be embroiled in disputes between factions because they feared repercussions from superior factions. This led to silence on social injustice.
Everyone has their own opinion, and someone can have a different opinion against me. But others think
‘He is not from the same faction’, and ‘He is opposite to me’ rather than understanding each other. This
was very a huge reason I couldn’t have my own opinion. Even though the line has power now, this line
can be a rotten rope if it became degenerate. But if I already got this line, and the senior got sack for
some reasons, I may lose my future [Current athlete, Dae-Won]

Interestingly, factionalism hindrance was also suggested by KPC members. For example, one KPC
member, who oversaw one disability sports organisation, was considered a high-status person within the South
Korean Para-sport system, felt his voice had occasionally been disregarded because he belonged to a different
faction, one that was opposed to the faction to which another KPC board member—who held ’more power’ in
disability sports—belonged. As he said:

I am against other KPC members. Because I know about reality so much, other board members don’t
like my voice (behaviour). I have been at the forefront for social change, but now it is not good timing.
I cannot be a good person if I say my opinion against key people. Other board members who disagree
with me sit at a higher level than me. They may not like me and ignore my voice [KPC member, Sung-
Gyu]

Collectivism

A fifth theme representing Confucian influence on Para-sport activism was collectivism, which means
a “social pattern consisting of closely linked individuals who see themselves as part of one or more collectives”
in South Korea (Triandis, 1995). Each individual belonged simultaneously to two different types of collectivism
(e.g., Choi, Haslett, & Smith, 2019): a) horizontal (e.g., seeing oneself as being similar to others and highlighting
common goals), and b) vertical (e.g., being loyal to one’s group and adhering to hierarchical interpersonal
relations). The current athletes belonged to two groups: the ‘athlete group’ (more horizontal collectivism) and the
‘Para-sport group’ (more vertical collectivism). The former encouraged activism by promoting harmony and
cooperation among athletes, whereas the latter discouraged activism as it could have repercussions from high-
status board members. This was because of the tendency of high-status board members to see an individual’s
behaviour as a group identity. This could be also interpreted by a Woo-ri approach.

The word ‘Woo-ri’ (우리) translates to ‘we’ in English but is used as an alternative form of ’I’ in Korean
linguistic. This word reflects the strong collectivist identity that is engrained in the Korean language. While in many Western cultures people orient themselves towards a self that distinguishes them from others (Lim, 2016), South Koreans adopt a perception of the self that is influenced by their relationship with others. In this study, one current athlete-activist spoke out for the development of his sport group (e.g., Para-snowboard, wheelchair tennis) against KPC. However, his activism incurred negative outcomes (i.e., all group members were deemed as an impertinent) to his sport group from KPC board members in a vertical collectivism environment. Another athlete member of this group evaded him because they thought their group (Woo-ri) was reviled by his dogmatic behaviour. However, they also blamed him when he kept silent regarding social injustice issues for the group (Woo-ri) in spite of being a medallist. This contradictory feedback from peer athletes and KPC members led him to face identity dilemmas, oscillating between athlete-activist identity and collectivism identity. In other words, Woo-ri culture could lead to a stronger activist voice, but also people might be stuck on the frame of Woo-ri without further movement. As one current athlete said:

How do Koreans call this country? ‘Our country’. Our country… We’d like to call us ‘Woo-ri (we)’. We are a community that has a strong fence. Korean always calls themselves ‘we’. How about a foreign country? ‘You’, ‘He’, ‘She’, they call someone directly and firmly. We are different. We are just us. When talking, people would say ‘The damn guys are wrong’, rather than ‘He is wrong.’ Speaking bad, Koreans tend to generalise easily. So, if I do wrong, it is bundled up totally, not a personal area. I’m an athlete. If I do something wrong, people think, “All athletes are in the same way”, not thinking it as my problem. So, I must not speak in front of people. It has been rooted in Korea society for a long time. The word ‘we’ is used all the time even when we don’t recognize. So, I try to hide my voice, be far from people, and avoid being around them. What happens next? “He only knows himself”, “He never cares us”, “He does not want to speak for us”, people say [Current athlete, Yun-Young]

Discussion

This study addressed the influence of Confucianism on disability activism from the perspectives on current disabled elite athletes and KPC members in Para-sport. This article contributes to the fields of sport sociology and Cultural Sport Psychology (CSP) by highlighting a new line and meaningful motivation-focused approaches of Para sport activism grounded in the unique cultural background of South Korea. Drawing on a CSP
approach, five cultural themes highlighted the significance of Confucian values in understanding athletes’ and KPC members’ attitudes and their relationship. CSP was an essential approach here because the South Korean traditional culture remains pertinent and transformative today. Based on our results, below we discuss the influence of Confucianism culture on Para-sport activism distinguishing the two perspectives of motivators and barriers.

All five Confucian factors positively influenced the activist intention of both disabled elite athletes and KPC members. On the one hand, disabled elite athletes were primarily encouraged by a high position in disability society and athlete-collectivism. This is remarkable because in the past (30 years ago) disabled athletes were perceived through the lenses of a medical model whereby they were regarded as ‘flawed’ and, therefore, were subordinated to non-disabled people. With regard to athlete-collectivism, athlete-activist could influence other potential athlete-activists (Smith et al., 2016). Various studies (Lim, 2009; Yeo, Wildman & Choi, 2017) found that Confucian harmony has two distinct motives in collectivistic Asian societies: a) appreciation of harmonious relationships (interpersonal trust), and b) harmony as a means to other ends (information sharing framework). For example, the South Korean ice sledge athletes exhibited their interpersonal trust when they collectively participated in the 2018 documentary film ‘We ride a sled’ aimed to raise awareness on disability rights and Para-sport. On the other hand, KPC members were mainly supported by position advantage, factionalism, and senior age factors. Plummer (2019) indicated that key people sitting at top hierarchical positions have extensive and pervasive dominant narrative power (e.g., accompanying legitimacy and credibility). By taking advantage of this power, KPC members focused on the instrumental advantage of their large network to lead social changes. For example, KPC negotiated with the Government to inaugurate 150 new public disability sports centres by 2025. In addition, in 2019 KPC achieved an agreement with the Korea Employment Agency for persons with Disabilities (KEAD) to create around 1,500 employments for disabled retired athletes.

However, the five Confucian factors also discouraged activist intentions. The strong Confucian culture, rooted in people’s daily lifestyle, has led to a rejection of direct political and social action to change the disability culture in South Korea. In traditional Confucian philosophy, inter-class conflicts were attributable to lower-status groups being impolite and disrespectful. Therefore, KPC members were discouraged by those disabled athletes who assumed a hostile attitude towards these five Confucian factors. With the wave of human-rights movement in contemporary South Korean society its influence on modern generations (e.g., those of current disabled elite
athletes), Confucianism has weakened compared to that on older generations (e.g., those of KPC members). The formation of intergenerationality shows dichotomous cultural identities by two different generations and led to conflict and hostility for both groups in Para-sport. This tension is shaped by social hierarchy between athletes and KPC members. In South Korean Para-sport, social personality tended to be implicitly formed by coordination and harmony with a group (e.g., athletes’ group) rather than individual social standards (Moon & Han, 2013). This led disabled elite athletes to develop dual personalities including an inner identity (e.g., activist or whistle-blower against unfair oppression in the hierarchy) and an outer identity (e.g., passive surrender by suppressing their real emotions and anger). This phenomenon, called ‘Han’, which is defined as an uncontrollable emotional state of frustration caused by the cognitive appraisal of unfair discrimination and oppression (Choi, Haslett, & Smith, 2019), led disabled athletes to be silent on social injustice in the sports environment. As another example of social hierarchy in the relationship between athletes and their parents, the Confucian influence (e.g., children should follow parents’ directions) and negative stereotypes (e.g., disability is conceived as a tragic medical problem) dominate disabled athletes for home-adjustment life by their parents’ intention, whereas the Western rights-based paradigm primarily contributes to supporting disabled children’s independence outside the home (Poon-McBrayer & McBrayer, 2014). This led disabled elite athletes’ voices to be oppressed and often filtered through the views of their family members.

Notwithstanding the negative influence of Confucianism on disability sports society, Para-sport is a suitable context to promote disability activism in South Korea. In order to achieve social changes, cultural legacy can be used as a useful framework through a commonly shared vision and collaboration of athletes and KPC in South Korean Para-sport. In the case of disabled elite athlete sides, they can lead to societal and inspirational contributions of athlete-activism with a sociocultural legacy in disability society. We can culturally envisage three ways to amplify their influence on social change and the athlete-activism continuum. First, confrontational conflicts due to age hierarchy and corrupted factionalism among disabled elite athletes should be abated at least, and athletes should respect individual fairness to maintain the harmonious relationship that is congruent with the Confucian value of horizontal collectivism (Lim, 2009). Second, athletes should be more subjective to protect their rights from people who sit at higher-level in the Para-sport committee, rather than conformity to unfair cultural barriers. Third, building an athlete-parent relationship based on mutual respect, support, and trust is needed because parental influence is a cardinal value of Confucianism especially for disabled people (see Figure 1). In the case of KPC board member sides, the interaction with key people within dominant factions (e.g.,
politicians, disability organisations) can lead to political and practical movement with legal, institutional, and organisational legacy in a wider disability landscape. In order to collect more influential voices with athletes-platform, minimising friction between athletes and board members is necessary. In this regard, KPC members should lead emancipation from the closure of the traditional kin network and patronising attitude towards disabled athletes in Para-sport. One way to actualise this movement may be to create emotionally safe spaces for current and potential athlete-activist by respecting for athlete individual’s voices regardless of any condition such as different factions and age gaps (Brown & Pickerill, 2009; Choi, Haslett, & Smith, 2019). In other words, activism led by the combined voices of inspirational athletes and powerful KPC members can serve as strong vanguard and leverage of disability activism in diverse dimension (e.g., from the stronger promotion of accessibility for and wider social inclusion of disabled persons) through establishing solidarity backed by legislations and policies in rights-based paradigm.

Taken together, the IPC strategy should be considered not only at the international level of Para-sport legacy but also at the cultural and national level to enhance the feasibility to promote disability activism through Para-sport. Given the complexity of understanding social attitudes, perception, and unique national culture intricacy, overlooking cultural subtleties can lead to unintended consequences of IPC visions in different ways. For example, You and Hwang (2018) indicated that South Korean disabled people’s movement has undoubtedly made great advances in political legislation; however, the negative social and cultural perspectives of disability still remain lodged in the combined traditional and modern Confucianism era. From this perspective, the IPC strategy appears necessary to employ intersectionality of cultural approaches to critically examine the various access to social, economic, and infrastructural arrangements that affect access to activism and its influence on society (Haslett et al., 2020; Misener et al., 2016). In other words, the IPC strategy should resist international generalisation and be sensitive to the ‘localised’ interpretation with cultural subtlety and its spheres of influences.

Possible directions for future academic efforts also arise from this article. Despite the potential of readers to adopt something from this research to change their setting (i.e., transferability, see Smith, 2018), it is important to interrogate social values, political environment, institutional priorities, and cultural peculiarities for social change. First, different cultural perspectives of other East Asian countries on Para-sport activism should be considered. Some research found subtle differences bringing in big impact of Confucianism on social model among East Asian countries (Huang & Chang, 2017; Sleziak, 2014). Second, future research could consider
what types of activism disabled athletes prefer to participate in to achieve a better understanding of the
multifaceted nature of activism and highlight their potential impact on society. Third, academic discussion on
disability activism from a disability social models are needed to gain an understanding of the sociocultural
background and movement in the South Korean context (e.g., You & Hwang, 2018). Some research introduced
the Western social model of disability in South Korea (Kim, 2002; Lee, 2018). However, lack of theoretical
approach and discourse on disability movement remain outside vigorous debate by factional tension, political
rivalries, and cultural gaps in South Korea, which resulted in the stagnation of anachronistic perspectives
towards disability based on a medical model (You & Hwang, 2018). Finally, future research in South Korea
must not deny the cultural lens. The importance of Confucianism in South Korean history and culture is
undeniable. Despite that South Koreans do not learn Confucianism theory at school anymore, Confucian
philosophy is still the dominant social system as a basis for day-to-day lives. Culture has developed and
transformed, but culture settings have relatively many variables holding back progress. In this regard,
researchers should not shy away from considering how cultural values have shaped athletes’ behaviours and
activism orientation, especially in Confucian countries based on hierarchical cultures.
